LCN-P

LCN Programming Software for MS DOS
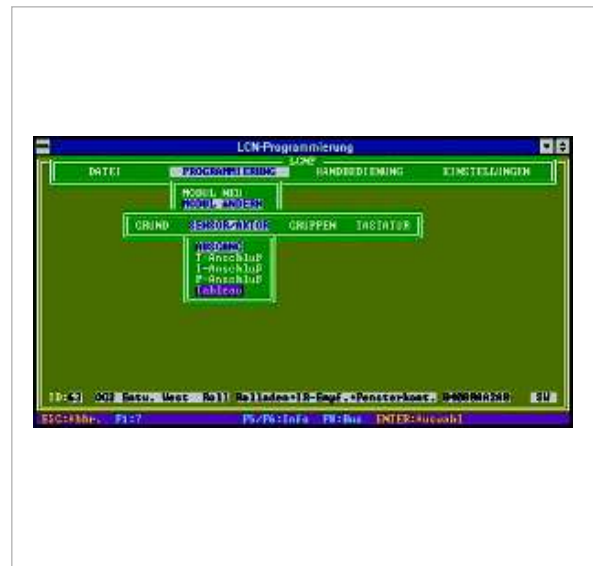

Functional Discription:

Thanks to the clearly-structured menu handling, operating the DOS programme is quick and easy. It offers all functions for programming, manual control and fault finding.

The LCN-P automatically searches all modules on the network and makes them available to be programmed.

The software can be used in running operation (without interruption of operation).

LCN-P offers a record function that notes all bus events up to the duration of one year and puts them in files on a daily basis. For evaluation the Windows programme PANALYSE is available and is free of charge.

An exceptionally powerful tool is the built in programming language LCL. It can be especially used in large buildings for fully automatic parametrization in all areas.

Field of application:

Installing and programming all modules on the network. Additionally it is possible to control functions and query individual modules.

Once commissioning is complete it is possible to print out the complete documentation of the network.

Technical Data:

Computer:

Processor:	486 (or higher)
Main memory:	min. 2MB
Hard disk:	LCN-P can be started by disk
Operating system:	DOS, Win9x or WinME
Display:	640 X 480 Pixels
Entry system:	standard keyboard
Interface:	Rs232

Note:

In order to allow communication with LCN modules, you also need the PC coupling module in addition to the LCN software.
